“Going to University” has Changed

Higher Education Policy

- ‘Mass’ participation
- More vocationally-oriented education system
- A ‘deregulated’ higher education sector
- Increasingly competitive, global higher education market
- Increasing Higher Education costs ... to the student

Educational Technology

- Rapid technological change and adoption
- The gradual maturation of online learning
- Social Networks: informal learning communities
- Open Educational Resources: Free, high quality, online content
- MOOCs: credentialing, nano degrees

SOLVE

A red arrow originates from the 'Educational Technology' section and points back to the 'Higher Education Policy' section. The word 'SOLVE' is written in red, bold, uppercase letters above the arrow.

Image removed

But ... It's a Myth!

Educational technology has failed to live up to its promise.

- Educational technology has not revolutionised or fundamentally transformed teaching, learning and assessment in Universities.
- Universities have not done a particularly good job of using technology in systemic ways to enhance and support teaching, learning and assessment.

But ... It's a Myth!

Educational technology has failed to live up to its promise.

“... the reality is that e-Learning is still marginal in the lives of most academics, with technology being used for little more than acting as a content repository or for administrative purposes”

- Grainne Conole, 2004.

“...the formal use of computer technologies in many areas of higher education could best be described as sporadic, uneven, and often ‘low level’”

- Neil Selwyn, 2007.

- *Given such promise,*

WHY

- *have educational technologies been more Myth than Messiah in their transformation of*

- *teaching, learning and assessment?*

Why?

1. We tend to focus on the wrong thing

3

Interactive
Learning, Teaching
and Assessment

We need to focus
more on
using technology
to support this

Inquiry
and
Research

Interaction and Interactivity is Key

Teacher-Learner	Learner-Learner	Learner-Content
-----------------	-----------------	-----------------

Defining Educational Interaction

Teacher-Learner

Learner-Learner

Social Learning Theories

- Vygotsky

Different viewpoints are inherent in collaborative work and this results in the “co-construction of knowledge”. Intra-individual conflict may occur in the process of “reciprocal sense making” which results in cognitive change.

- Piaget

Different viewpoints are inherent in collaborative work which results in inter-individual conflict. The resolution of this conflict – assimilation and accommodation – results in cognitive change.

Learner-Content

Taxonomies and Classifications

e.g. Schwier & Misanchuk (1993)

Reactive ↔ Proactive ↔ Mutual

- Functions
- Transactions

How do you do Interaction?

Why?

*Given such promise,
WHY
have educational technologies
been more Myth than Messiah
in their transformation of
teaching, learning and assessment?*

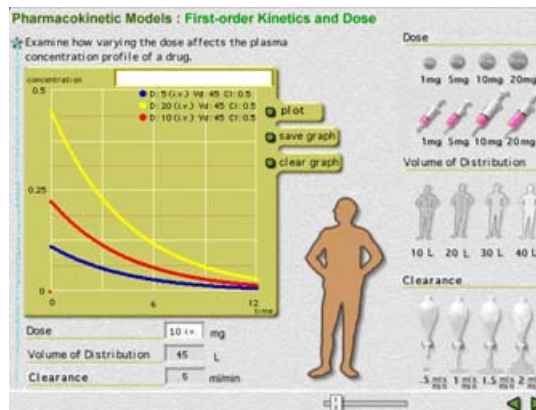

Examples

2. Often we fail to design for interaction

Example 1: Interactive Multimedia

- Allow students to explore how pharmacokinetic concepts – dose, volume of distribution, clearance – affect pharmacokinetic parameters – half-life and peak plasma concentration.
- An emphasis on conceptual understanding rather than mathematical formulae.
- Employs real life examples and analogies, interactive tasks, and a “faux” conceptual simulation.

Did Students Like It?

- Tested with 173 Medical Students in a problem-based curriculum
- Students' perceptions of usefulness (9-point scale)

Resource	Mean	Std Dev
Pharmacokinetics Tutorial	7.33	1.37
Text Books	6.78	1.62
Lectures	6.72	1.41
Lecture Notes	6.68	1.37
Personal contact with Tutors	6.21	2.17
Group discussion	6.12	1.93
Journal articles	4.04	2.43

Did it Work?

- Tested with 173 Medical Students in a problem-based curriculum
- Students' knowledge (5-point scale) and perceived confidence (7-point scale)

	Pre-Test Mean (SD)	Post-Test Mean (SD)	F	p
Knowledge	3.85 (.98)	4.17 (.87)	4.16	<.001
Confidence	4.59 (1.22)	5.97 (.87)	17.48	<.001

How does the learning design of interactive multimedia programs affect students' learning approaches and outcomes?

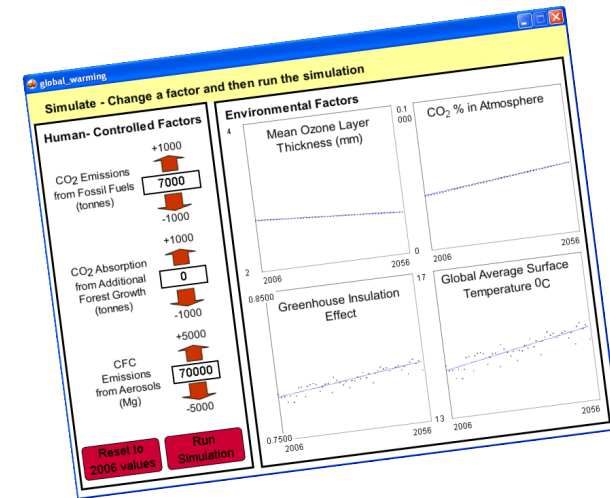

Exploration Learning Design

- Content screens: an introduction with background terminology.
- A conceptual simulation task.
- A “predict, observe and explain” task; students are given a scenario, they alter simulation values, observe the impact, and have to work out fundamental principles.
- Students manipulate various parameters.

Tutorial Learning Design

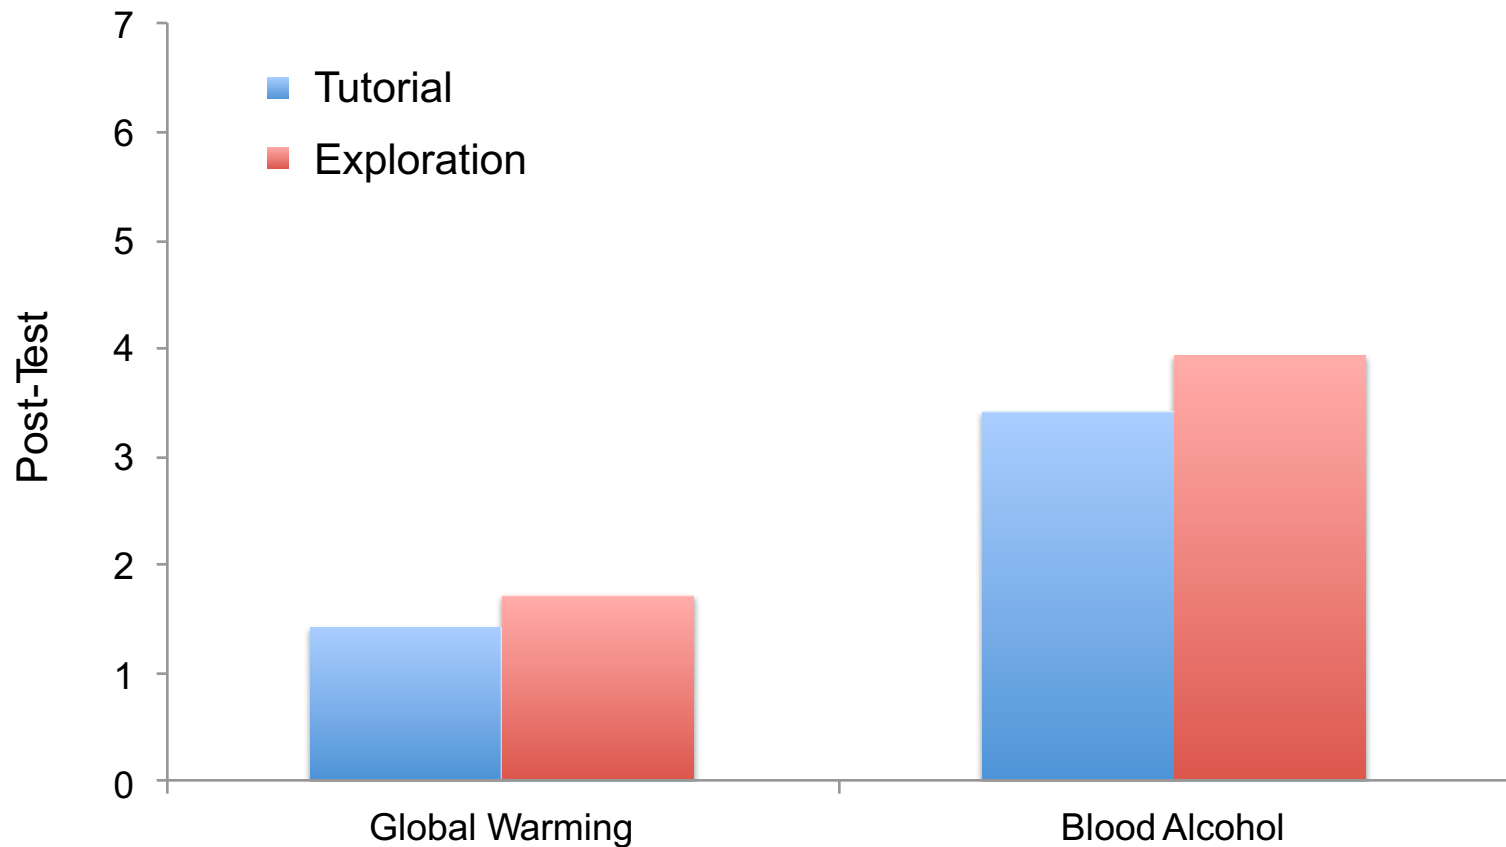

- Content screens: an introduction with background terminology.
- A “page-turning task”.
- Content screens that show students the impact of altering values of “a simulation” on an particular outcome.
- Students were not able to manipulate the parameters.

- Cross over design
- Each student completed:
 - the tutorial program in one content area (Global Warming)
 - the exploration program in a second content area (Blood Alcohol Concentration)
 - a pre and post-test of knowledge in each content area
- Students' learning behaviour and activities were logged.

- No statistical difference between groups for Global Warming
- Only a modest difference between groups for Blood Alcohol

- We noticed there was a great deal of variation in the post-test scores for students in the exploration condition.
- Eyeballing the logs showed some students seemed more systematic in their exploration of the simulation than others.

We characterised students' approaches to learning with the simulation using a simple rule.

Systematic Exploration

- Students who consistently completed simulation “cycles” – predict, observe, explain – changing only one variable at a time.

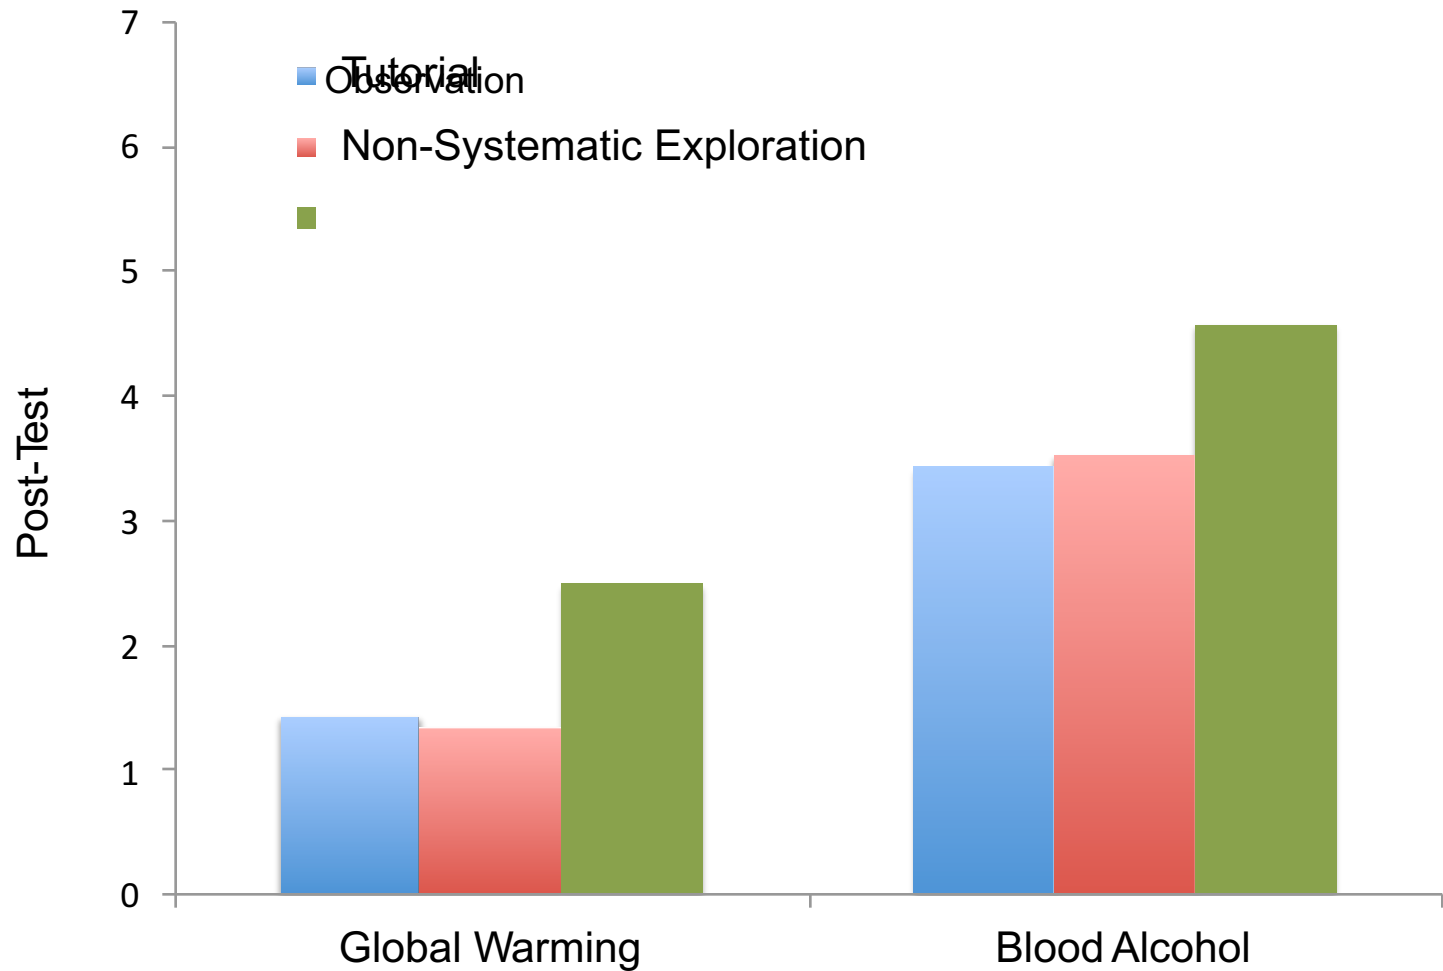

Non-Systematic Exploration

- All other “exploration” students

Tutorial

- Students who completed the Tutorial learning condition (no simulation)

The “systematic” group differed from the other two groups in both domains

Example 2: Online Learning

ORALE Online: A Computer Mediated Communication Environment for Teaching Law

ORALE ONLINE: A COMPUTER MEDIATED COMMUNICATION ENVIRONMENT FOR TEACHING LAW

ABSTRACT

Dispute Resolution and Legal Ethics (DRLE) is a subject taught by Prof Martin Davies. All law undergraduates at the University of Melbourne must complete the subject in order to qualify for admission to practice law. The subject's aim is to give students the necessary background on the resolution of disputes, the ethical responsibilities of a lawyer, and the duties owed to the law, the court and the client. This involves practical things such as handling casefiles and communicating with other parties, including opposing law firms, senior partners, the client, the court, and other agencies. Students need to learn the mechanics of the dispute resolution process as well as the ethical issues involved in the process. For example, clients must be asked for direction at critical stages, and all documents which go out of a Law firm should be signed by all partners in the firm.

ORALE Online is a system which has been developed to simulate this process in a web-based environment. This is not a distance learning unit. Students who study this unit also participate in face-to-face lectures and tutorials. Real casefiles have been modified to remove identifying information such as company name, and then placed on the system. Each student is assigned to a Law firm with 4 other students. These firms are then made either plaintiffs or defendants, and matched with an opposing firm. When each student logs in, they have access to the appropriate casefiles on a set of documents which have been

Example 2: Online Learning

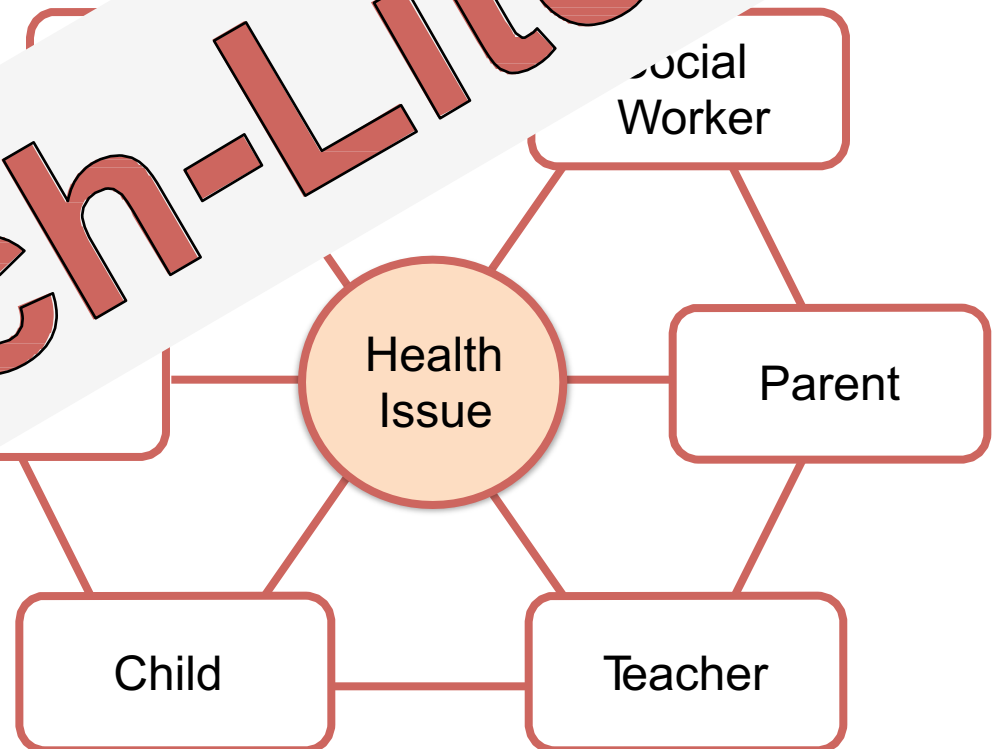

- Problem based : Ill-structured problems used as a vehicle for developing students' understanding of concepts, processes and principles

- Scenario

- Authentic

- Role Play

Tech-Lite

Example 3: Social Media

Two Photo Sharing Activities

Learning Design A: Beetle Gallery

- A traditional beetle collection exercise extended with technology.
- 30% of assessment mark.
- Campus-based and distance students (n ~ 40) uploaded and shared digital images in an online “Beetle Gallery”.
- Undertook comparisons of shared images.

Learning Design B: Chem Flickr

- Document key principles covered in Chemistry lectures as they occur in everyday life.
- A ‘hurdle’ assessment requirement.
- Campus-based students (n ~ 900) uploaded and shared digital images in an online gallery, captioned and tagged them.
- Commented and voted on others’ images.

Example 4: Procedural Skills Simulation

- Learn how to complete a cortical mastoidectomy

“Drill away the bone behind the ear ... safely”

- A procedural simulation task which aims to develop students’
 - psychomotor skills
 - procedural skills
 - decision making skills
- An deeply immersive, interactive, authentic and adaptive digital learning environment

Does it work?

- Zhao, Y., Kennedy, G., & O'Leary, S. (2011).
The Laryngoscope, 121(4), 831-837.
- Zhao Y., Kennedy G, et al. (2011).
Otolaryngology Head and Neck Surgery, 144(3), 357-364.
- O'Leary, S., et al. (2008).
The Laryngoscope, 118(6), 1040-1046.

- Learn how to complete a cortical mastoidectomy

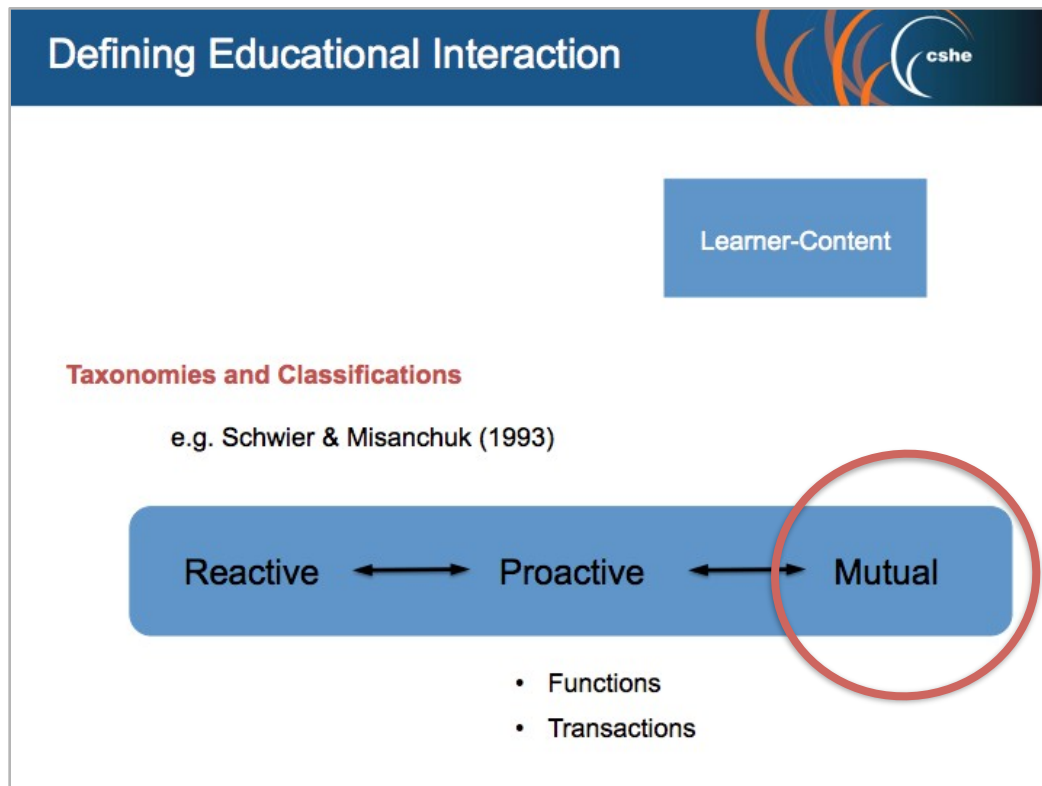

“Drill away the bone behind the ear ... safely”

- A procedural simulation task which aims to develop students’
 - psychomotor skills
 - procedural skills
 - decision making skills
 - An deeply immersive, interactive, authentic and adaptive digital learning environment
-

Mining Interactions for Feedback

- We wanted to use records of students' interactions to provide personalised, adaptive feedback to surgical trainees.

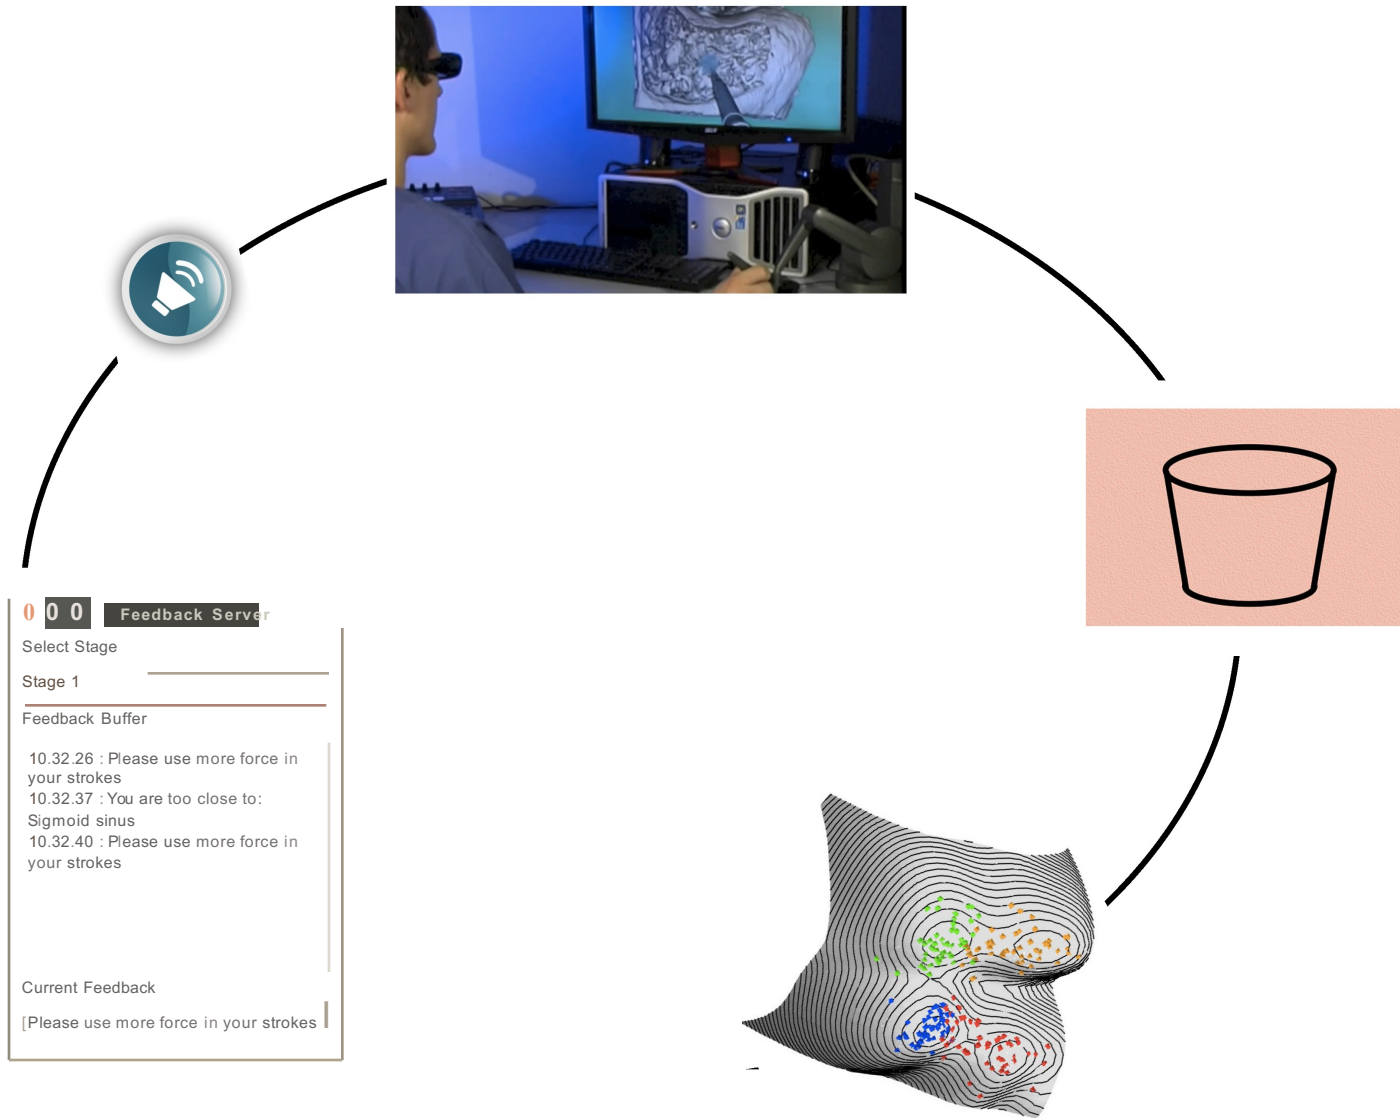

- Tool position in 3-dimensional space
- Tool orientation – pitch, roll, yaw
- Force – how much pressure applied
- Distance to key anatomical structures
- Surgical stroke – length, smoothness
- Rotation of the bone (patient's head)
- etc

----- 15 records of 48 metrics generated per second -----

Model of
Novice Behaviour

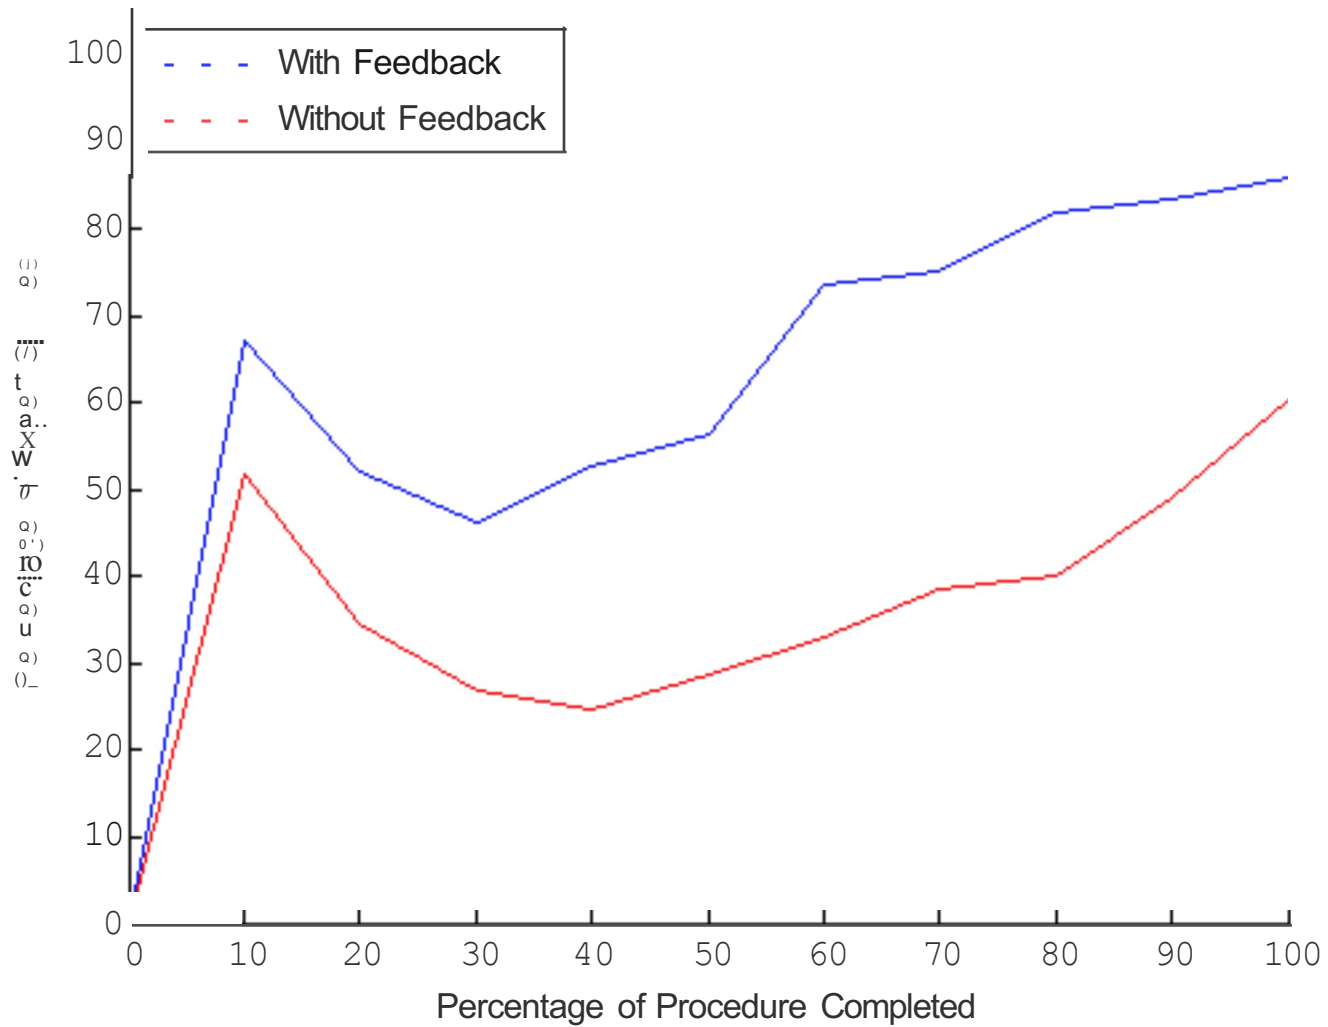

Model of
Expert Behaviour

Mining Interactions for Feedback

- 24 medical students
 - 12 were provided with automated feedback
 - 12 were not
- Knowledge of anatomy but not surgery;
video tutorial of surgery and simulator familiarisation.
- Two group comparison of students' performance on a cortical mastoidectomy

Designing for Interaction

Teacher-Learner

Learner-Learner

Learner-Content

How do you do Interaction?

Why?

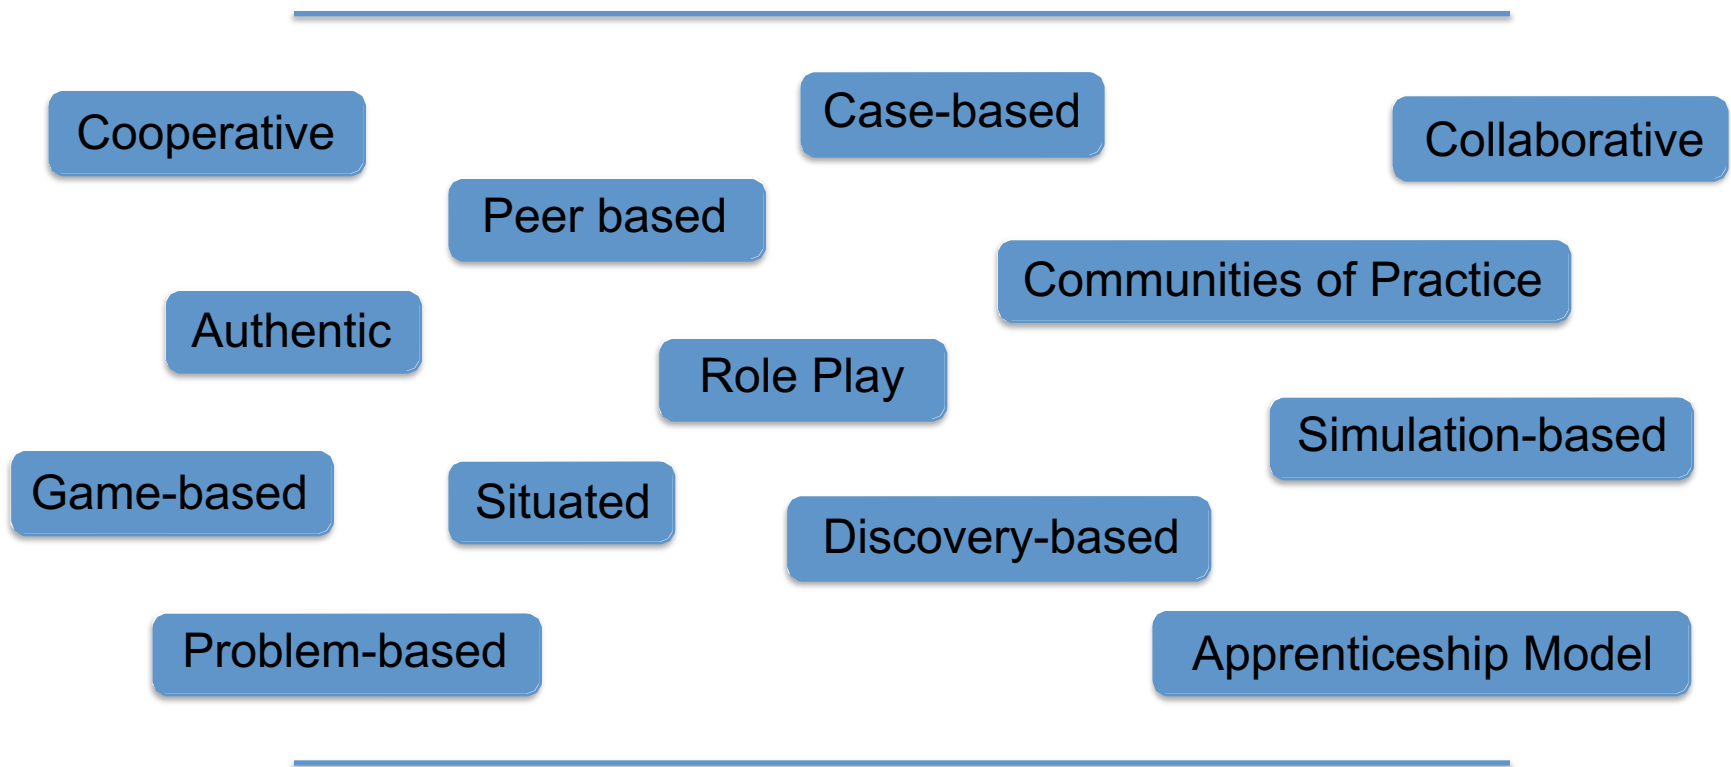

*Given such promise,
WHY
have educational technologies
been more Myth than Messiah
in their transformation of
teaching, learning and assessment?*

Examples

2. Often we fail to design for interaction

Designing for Interaction

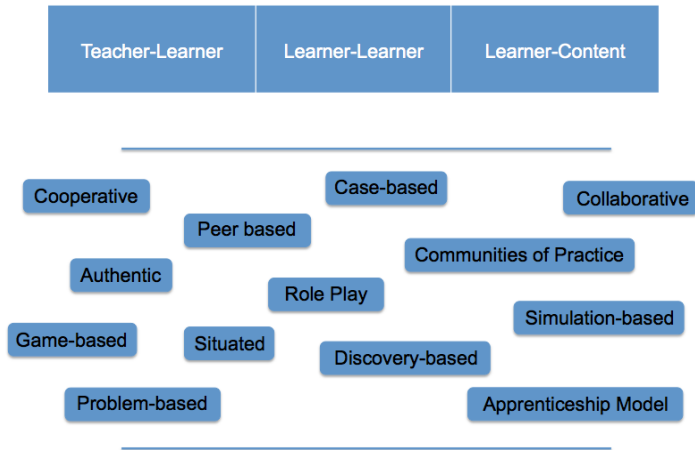

1 Management and Administration of Teaching and Learning	3 Interactive Learning, Teaching and Assessment
2 Delivering and receiving electronic teaching and learning resources	4 Scholarly Inquiry and Research

1.

“Educational” technology has a range of different roles and values.

Universities have tended to focus on the use of technology to support access to and management of education.

We need to continually remind ourselves to focus on the use of technology to support genuine, generative teaching, learning and assessment activities.

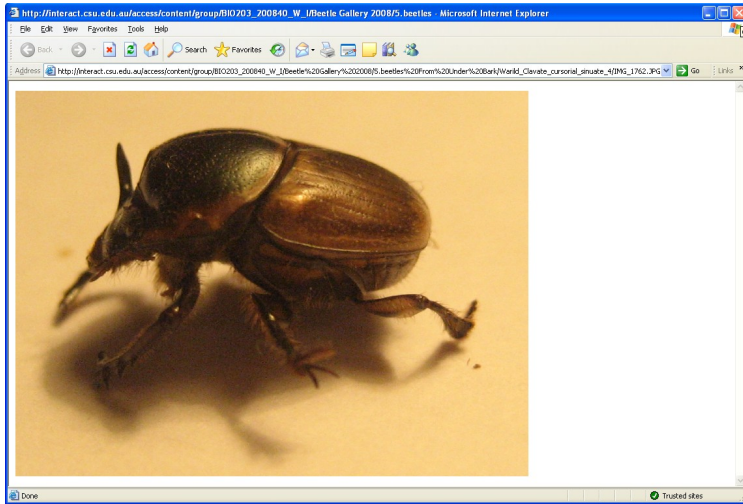

2.

Learning Design is King.

The pedagogical design of our digital learning environments is the key to their success. Not the technology.

Meaningful interaction – between and among teachers, students and content – is critical.

There are well established learning design frameworks and models to draw on here.

3.

Constructive alignment is Queen.

The learning objectives, the design of the task or activity and the assessment need to be aligned.

Combining this idea with 2.

= Biggs' (1996) notion of *Constructive Alignment*.

Blackboard

4.

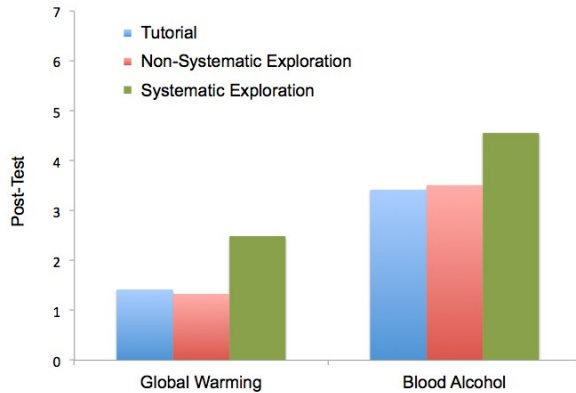

With **2.** and **3.** in place, the technology recedes into the background.

To put it another way ...

... you don't need super duper technology to create great digital learning environments.

or

Exceptional learning design can be enacted with modest technologies.

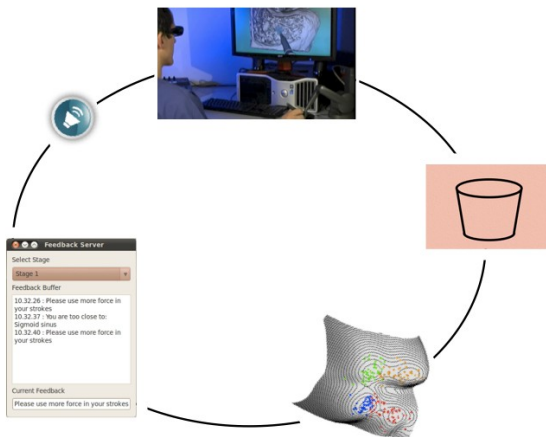

5.

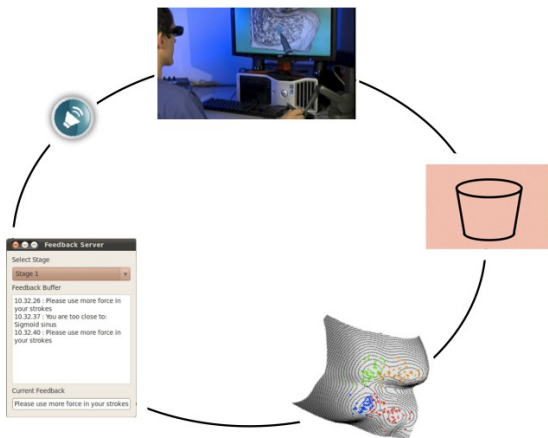

Learning Analytics – logging students' interactions – is a powerful tool.

It can be used to show how students are interacting with, and within your digital learning environments.

So you can:

- intervene in the learning process;
- provide feedback about content;
- provide advice and support; and/or
- improve the learning design.

5.

Learning Analytics – logging students' interactions – is a powerful tool.

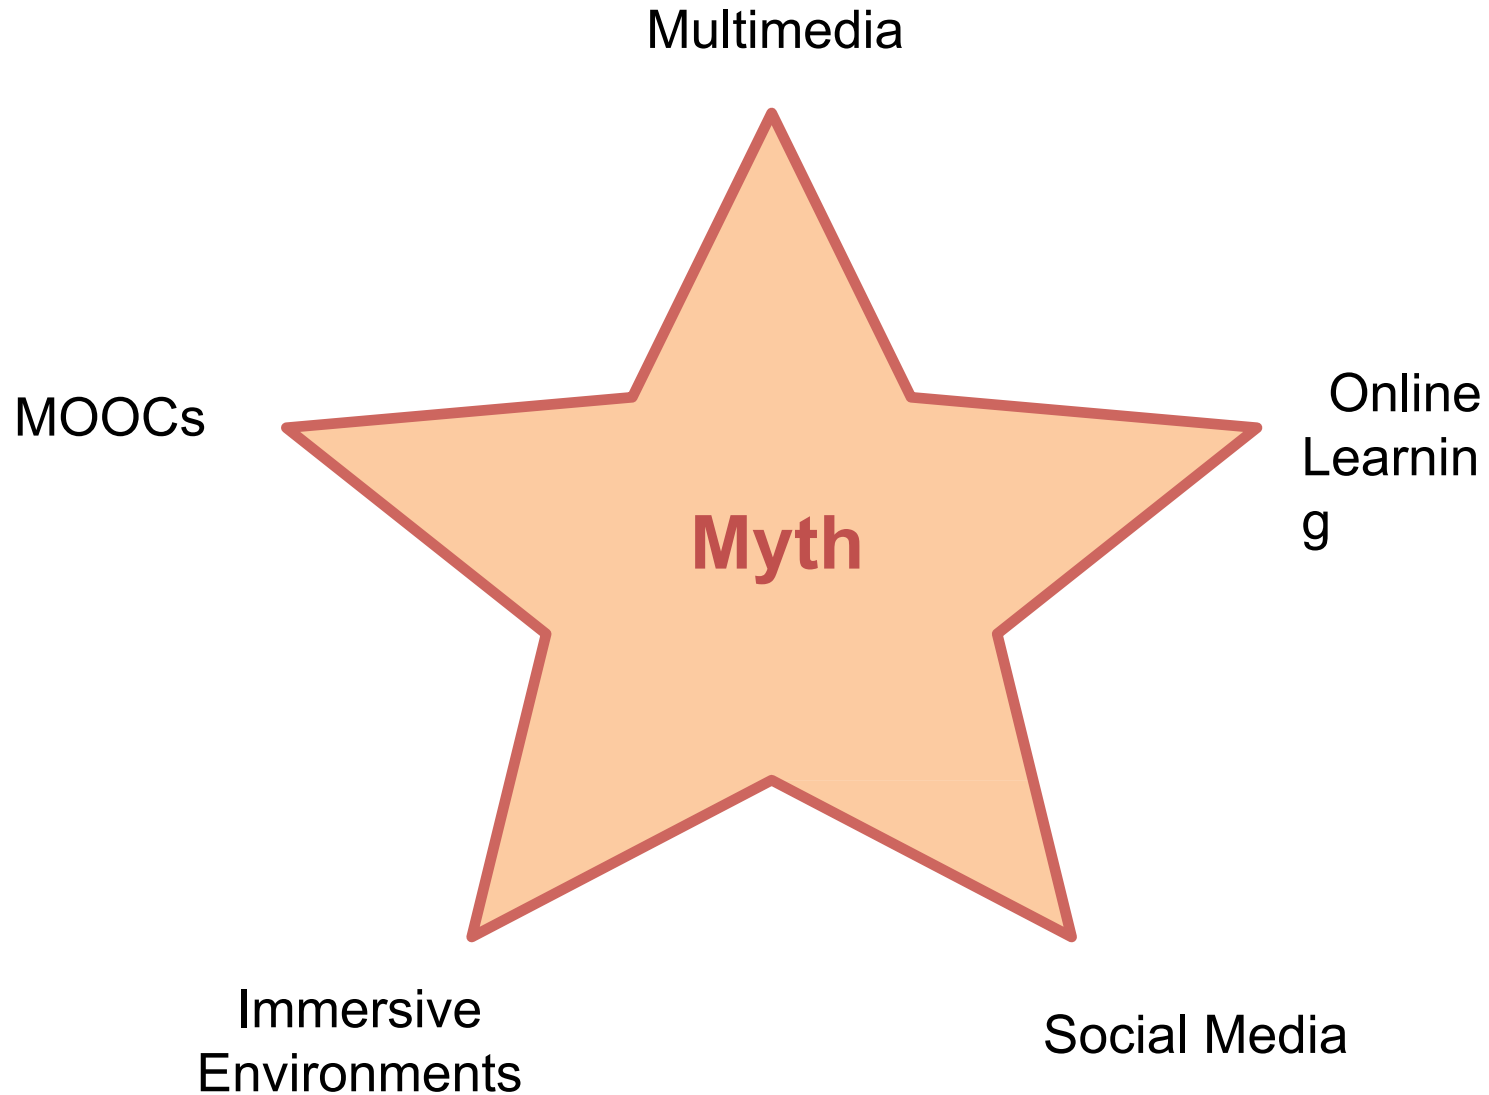

It can be used to show how students are **interacting** with, and within your digital learning environments.

So you can:

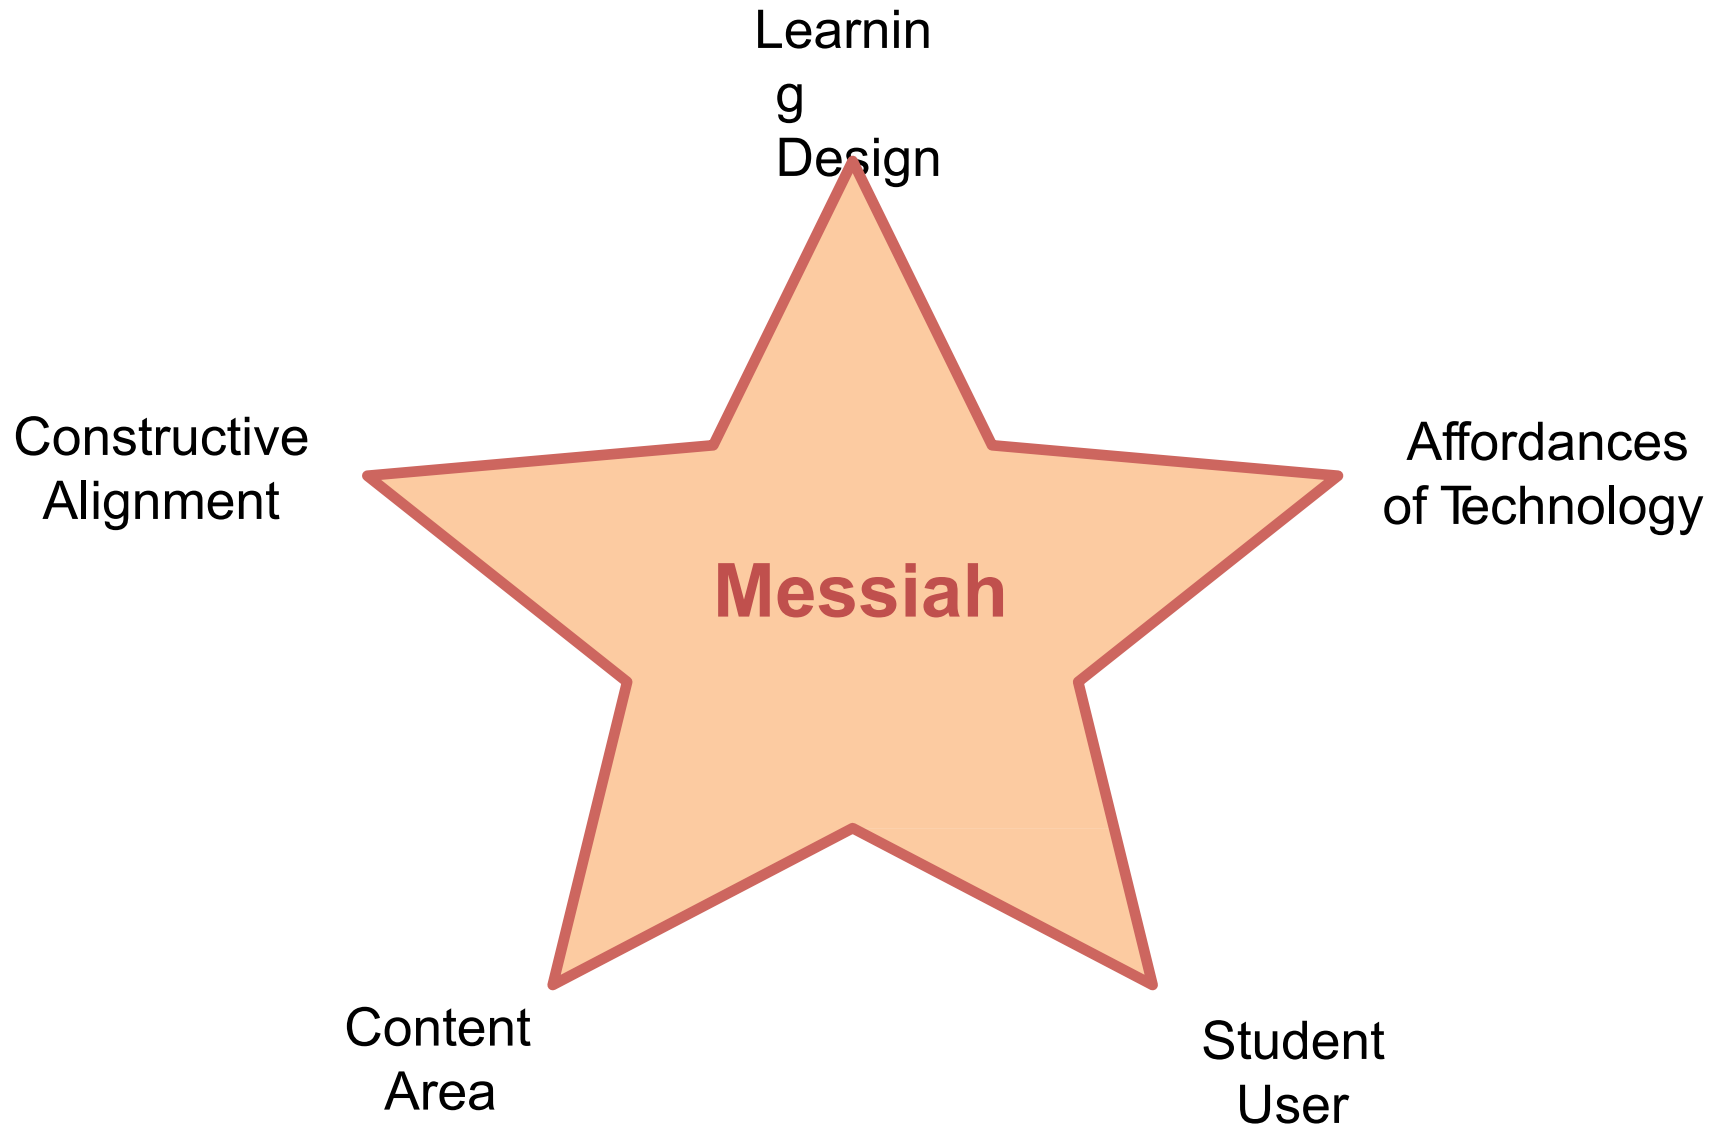

- intervene in the **learning process**;
- provide **feedback** about content;
- provide advice and **support**; and/or
- improve the learning design.

Messiah or Myth: The core values of technology in university education and learning
